

Case Analysis — filled in, Team 13

Task: Choose 2–3 cases, identify the key problems, and think about possible solutions.
The three cases come from the real list of exhibitors at the action day **"Dein Netz, Deine Regeln!" ("Your Net, Your Rules!")** at Bürgerhaus Wilhelmsburg (31.08.2026, buewi.de/netz-ablauf) – researched, not invented.

CASE 1	juuuport – Cyberbullying/hate speech against individuals
CASE 2	Amadeu Antonio Stiftung / HateShield – coordinated hate attacks against communities
CASE 3	digi&demo – Disinformation/manipulated content

Ideas on Case 1 — juuuport

Online counseling platform, run by and for young people.

Core problems	1. Young people experience cyberbullying/hate speech directed at them personally. 2. Reporting/help features on major platforms feel impersonal and slow. 3. Those affected often don't know who to turn to.
Who is affected?	Young people who are attacked online.
Possible solutions	1. Low-threshold peer-to-peer chat instead of an anonymous report form. 2. Visible status after a report is filed ("reported → reviewed → outcome"). 3. A collection of ready-made, factual counter-speech replies to reuse.

Ideas on Case 2 — Amadeu Antonio Stiftung / HateShield

Project "HateShield – Connected Communities", supporting communities affected by racist digital violence.

Core problems	1. Coordinated hate campaigns ("shitstorms") targeting marginalized groups. 2. Individual targets/small communities have little capacity or knowledge to defend themselves technically and legally. 3. Attacks are often undocumented, making them hard to prove or report.
Who is affected?	Marginalized groups, activists, small community accounts.
Possible solutions	1. A shared "protection checklist"/template for communities. 2. A simple documentation tool for evidence (screenshots + timestamps). 3. Networking affected communities together as an early-warning system.

Ideas on Case 3 — digi&demo

Interactive booth: an opinion board on social media plus an online game testing the ability to spot manipulated content. Runs its own project "pleenum" for constructive digital discourse.

Core problems	1. Young people/young adults struggle to tell manipulated/fake content from real content. 2. Disinformation undermines trust in political debate. 3. Existing awareness campaigns often don't reach the target group (too dry/theoretical).
Who is affected?	Young people/first-time voters who get political information via social media.
Possible solutions	1. A gamified "spot-the-fake" trainer (similar to the digi&demo game), e.g. as a browser extension. 2. Short, everyday-usable explainer snippets instead of long educational texts. 3. A community-based fact-check feature (similar to Community Notes).

Tip (from the original worksheet): Focus on the problem first. Good solution ideas often become clearer once you know who is affected and why.

Next step (Wednesday): Pick one of the three cases as our focus and turn it into 1–2 problem statements. Case 1 and 3 fit "digital democracy" in the narrower sense best (see team notes in

the vault).
