

## Case Analysis (filled in, Team 13)

**Task:** Choose 2–3 cases, identify the key problems, and think about possible solutions.

Our direction is **digi&demo e.V.** (digiunddemo.de), connected via the action day "Dein Netz, Deine Regeln!" at Bürgerhaus Wilhelmsburg. digi&demo names three challenges to open digital discourse on their own site – those are our three cases, all seen through digi&demo's lens (their booth activities and their project "plenium").

|               |                            |
|---------------|----------------------------|
| <b>CASE 1</b> | digi&demo – Hate speech    |
| <b>CASE 2</b> | digi&demo – Disinformation |
| <b>CASE 3</b> | digi&demo – Polarization   |

### Ideas on Case 1: digi&demo, Hate speech

|                           |                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Core problems</b>      | <ol style="list-style-type: none"><li>1. Aggressive/toxic comments under political posts discourage people from participating.</li><li>2. Reporting tools on major platforms feel slow and impersonal.</li><li>3. Those affected often face coordinated pile-ons ("shitstorms") rather than single comments – hard to fight alone.</li></ol> |
| <b>Who is affected?</b>   | Young people/young adults who speak up politically – especially those from groups more frequently targeted by hate.                                                                                                                                                                                                                          |
| <b>Possible solutions</b> | <ol style="list-style-type: none"><li>1. Moderated discussion spaces with clear rules (similar to digi&amp;demo's "plenium").</li><li>2. Community-driven counter-speech tools.</li><li>3. Visible status after a report is filed ("reported → reviewed → outcome").</li></ol>                                                               |

## Ideas on Case 2: digi&demo, Disinformation

Reference: digi&demo's own booth game tests visitors' ability to spot manipulated content.

|                           |                                                                                                                                                                                                                                                                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Core problems</b>      | <ol style="list-style-type: none"><li>1. Young people/young adults struggle to tell manipulated/fake content from real content.</li><li>2. Disinformation undermines trust in political debate.</li><li>3. Existing awareness campaigns often don't reach the target group (too dry/theoretical).</li></ol>                 |
| <b>Who is affected?</b>   | Young people/first-time voters who get political information via social media.                                                                                                                                                                                                                                              |
| <b>Possible solutions</b> | <ol style="list-style-type: none"><li>1. A gamified "spot-the-fake" trainer (similar to digi&amp;demo's game), e.g. as a browser extension.</li><li>2. Short, everyday-usable explainer snippets instead of long educational texts.</li><li>3. A community-based fact-check feature (similar to Community Notes).</li></ol> |

## Ideas on Case 3: digi&demo, Polarization

Reference: digi&demo's own project "pleenum" directly targets open, constructive digital discourse instead of camp-building.

|                           |                                                                                                                                                                                                                                                                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Core problems</b>      | <ol style="list-style-type: none"><li>1. Algorithms/filter bubbles reinforce one-sided views (echo chambers).</li><li>2. Political discussions escalate quickly into "us vs. them" instead of real exchange.</li><li>3. Constructive exchange across differing opinions is rare online.</li></ol>                                     |
| <b>Who is affected?</b>   | Social media users who take political positions – especially young people who are still forming their political opinions.                                                                                                                                                                                                             |
| <b>Possible solutions</b> | <ol style="list-style-type: none"><li>1. A structured discourse format modeled on pleenum (show the opposing view before you can reply).</li><li>2. Nudges that encourage reading an opposing view before commenting.</li><li>3. Moderated cross-bubble formats that deliberately bring different political camps together.</li></ol> |

---

Tip (from the original worksheet): Focus on the problem first. Good solution ideas often become clearer once you know who is affected and why.

**Next step (Wednesday):** Pick one of the three cases as our focus and turn it into 1–2 problem statements.
